

The PFI

Automated pattern discovery for regulatory and project risk – built on real data, real projects, and five deceptively simple rules.

Harsh Patel

Gathered and classified every regulatory event across 11 real data center projects. Designed the five rules the system uses to decide whether two events are similar.

Alieel Pozo

Built the system that applies those five rules to organize all the data – and created the visual map that shows where each hidden project lands.

Graph Data Structure

Every regulatory event – an approval, a denial, a court filing – becomes a node. Similarity becomes an edge. The whole structure reorganizes as new events arrive.

How it works

Events as Nodes

Every regulatory milestone from 11 real projects is stored as a discrete node in the graph.

Similarity as Edges

Two events that match on the five rules get connected. The more matches, the stronger the relationship.

Live Reorganization

When a new event enters, it connects to everything similar already in the graph – and the structure reshapes around it.

The Problem We Solved

The Old Way

Most systems require a human to decide what to look for *before* looking. The data sits idle until someone tells it what to mean. You can only ever find what you already knew to ask about.

Our Approach

We removed the human instruction entirely. Five simple rules define similarity. The graph organizes itself. **Nobody told it what pattern to find – the pattern emerged on its own.**

The same way atoms don't need instructions to form molecules. The force does it.

What We Found

We ran a blind test. One project hidden. Ten used to build the graph. Then we injected the first 3 of its 9 events – without telling the system how it ended.

11

Real Projects

All with known outcomes

3

Events Injected

Out of 9 total per hidden project

8/11

Times Correct

The map predicted the neighborhood accurately

✓ **No labels. No training. Just position.** Projects heading toward court fights landed next to other court fights. Clean projects landed next to clean projects. The system never knew the outcome – the neighborhood told the truth on its own.
